1.0 Introduction

The objectives of these *Signage and Wayfinding Standards* are to provide direction and guidance to staff and third party contractors for the development of effective wayfinding within TTC facilities.

More specifically, it is designed with the following key objectives in mind:

- to support the TTC's Customer Information Strategy initiative – information customers need, when they need it;
- to facilitate optimal access to transit services for all customers regardless of impairment: mobility, cognitive abilities or language;
- to present a uniform sign system that communicates information effectively and efficiently;
- to ensure that wayfinding elements, such as signs, function within the context of their environment and do not detract from the customer experience;
- to promote best practices in the field of transit wayfinding and information design;
- to maintain high standards for customer care, consistent with the TTC's rich tradition of safety, service and courtesy.

These standards have been approved by the Toronto Transit Commission's Executive Board. All new TTC signs must conform to these standards.

The success of these standards can only be measured by the extent of their correct implementation, and it relies heavily on those who coordinate signage within each of the TTC's departments, partner agencies and third party contractors.

2.0 Planning principles

2.0 Planning principles

Introduction

The *Signage and Wayfinding Standards* contain a variety of guidelines, tools, and resources that will assist qualified design professionals to develop signage for TTC facilities. This section seeks to provide guidance on a general wayfinding strategy and specific rules applied to signage at the TTC.

The following planning principals should be reviewed prior to developing signage plans.

Meet the basic objectives of wayfinding

The basic objectives of wayfinding signage are to provide customers with self-navigation tools that will allow them to know:

- Where they are;
- Where their destination is;
- The best route to reach their destination;
- That they have arrived at their destination;
- How to find their way back to where they started.

In addition to wayfinding, signs are used to address other equally important objectives:

- Provide safety information;
- Post prohibitive instructions;
- Identify accessible pathways, devices, and services;

Meeting these objectives should guide decisions made on the types of signs used, message content, and placement locations.

Providing answers

There are a number of elements within the TTC system that work in concert together to provide customers' wayfinding needs. Thus it is important to understand that wayfinding elements must complement one another using consistent terminology, editorial style, tone, look and feel.

Proximity – Where am I?

Our customers must have a sense of their proximity at all times. Customers who know where they are become less likely to feel 'lost' and become more confident and empowered. Understanding proximity at points along a journey also contributes to an understanding of progress and an estimation of arrival at final destinations.

Our system provides a number of tools customers can access to keep track of where they are:

- 'You are here' markers on TTC System Maps;
- Station name signs at entrances and platform walls;
- Bus shelter street name identification;
- Visual and audible station/stop; announcements.

Our customers perceive the transit system as a large and complex environment. They rely on correct signing and information to make informed decisions for navigating through the system efficiently and safely.

The TTC Wayfinding System incorporates visual coherence, clarity, and simplicity for all elements.

A simple, clear and concise hierarchy of signing ensures easy to follow directions for customers including:

- Clear, legible and visible statements;
- Safe and effective use of the transit system;
- A unifying brand identity;
- Flexibility;
- Accessibility and inclusiveness for all users;
- Maintainability;
- and cost effectiveness.

The TTC sign system incorporates a number of elements that together ensure these objectives are met:

- High contrast design elements;
- Pictograms;
- Prominent directional arrows;
- Modular layout structure;
- Numeric and colour coding system.

Sign placement is determined based on the idea of establishing a unified progression of messages leading customers along their journeys. Sign placement generally occurs at the following points:

1. Arrival points

Arrival points are the locations that customers first arrive on a TTC property, usually subway stations or surface route stops. They could also be a point where customers are arriving from a connecting partner transit system like GO Transit

2. Informational points

These include *Plan your trip* information stations (with system maps and vicinity maps), Route connections (surface route platform map and route listings), Next Vehicle Arrival Screens (NVAS), Station Information Screens (SIS) and Station Hubs. Informational points are generally where customers can identify where they are, where they want to go and the best route to take in order to get there.

3. Decision points

Is a general term used to identify any point where customers have options or choices. Signs are required at decision points in order for customers to make informed decisions

4. Destinations

Destinations include both final destination and intermediate destination. A final destination may be a station on a subway line or stop along a bus route. Intermediate destinations may be a particular point in the journey that a customer needs to reach in order to proceed to the next stage of their journey. Signs posted at destinations inform customers that they have arrived or reached a key point along their journey.

Anticipate multi-modal journeys

Typical journeys for TTC customers involve several stages, using different modalities. These may include riding a bus, transferring to a subway, and completing their journey on a streetcar. These journeys are multi-modal, meaning that they will probably utilize a combination of methods and vehicles to complete a single journey. Customers plan these journeys by visualizing linear routes comprised of a sequence of steps. They use wayfinding information as a tool to piece journey plans together. Therefore, it is crucial that different modal systems, such as subways and streetcars, 'fit' together. Users need to be able to easily understand where and how they move from one point of their journey to another. Often, there are different route options to reach a single destination. Wayfinding information must illustrate differences, such as distance and time, clearly so that customers can make informed decisions about the best way to plan their journeys.

Intermodal stations

As we support our growing region, the operators of each agency play a part to assist customers across the region. Intermodal stations are stations with transfers between two or more operators. Our system pairs the operator logo with the modality for customers to navigate to the services they require. For example, Kipling station has MiWay buses, TTC buses and GO buses as well as a GO train and TTC Line 2. It is important to pair the logo with the modality as the buses are located in different bus terminals at Kipling station. Refer to the *TTC Intermodal Wayfinding and Signage standards* manual for more information.

Interchange stations

A transfer between two TTC subway lines is an interchange station. At interchange stations the terminus stations become important to support the line numbers. For example, Kennedy station is the terminus for Line 2, Line 3 and Line 5. When customers are trip planning at this station the line numbers are more clear when they are paired with their terminus: Line 2 Kipling, Line 3 McCowan and Line 5 Mount Dennis. At Bloor-Yonge, the station intersects two lines going all directions. Line 1 Finch / Vaughan via Union and Line 2 Kennedy / Kipling.

2.0 Planning principles

Microtransit at stations

Microtransit means using private modes of transit to provide on-demand service; it can be one way of helping customers bridge the first and last mile of their trip.

Microtransit pictogram modules should not be used on station pylons or station identification signs. Where appropriate, a stop marker sign may be installed outside a station with the microtransit pictogram module.

Where microtransit is present outside a station, directional signage inside the station should include the microtransit pictogram module. The name of the service may be used to describe the pictogram (example: IKEA shuttle bus, bike share, etc.)

Taxi stand and bike lockers

Taxi stand and bike locker pictograms should only be used on the egress exit sign closest to the taxi stand and bike locker.

Be predictable

Stress and anxiety for customers is reduced when they can anticipate where they can find information and it is presented in a familiar manner. Consistent placement and graphic presentation contribute to this predictability.

Universal design principles for accessibility also contribute to predictability. Information presented in a familiar manner, such as universally understood pictograms, make signs easier for customers to understand. They remove steps required to learn the sign system. This is especially important for our customers who are visitors to the city and may face language barriers.

Once a customer understands how an information system works they are more likely to be confident and comfortable as their journey takes them through unfamiliar places within the system. These familiar markers will serve as assurance that they are on the correct path.

TTC pictograms follow industry best practices for symbol design. For instance, a bus pictogram used

on the TTC would match the pictograms used for many other transit operators. Using pictograms that new users are already familiar with contributes to the ease of use and better understanding of signs.

Present information on different cognitive levels

Using a combination of words, colours, symbols and numeric codes to represent messages allows customers to interpret information in different cognitive ways.

These differences support the broad spectrum of customers riding the TTC. For instance, some customers have language barriers and only understand simple English; some customers are rushed and have short attention spans that make complex messages difficult to grasp; some customers are colour-blind and others may have cognitive limitations. For these reasons, it is useful to present information simultaneously on several sensory and cognitive levels.

Messages can be presented all together at once or in parts depending on how customers need the information. For instance, numeric codes provides customers with a shorthand method of identifying routes. These codes, once understood, allow customers to quickly identify TTC bus, streetcar and subway routes. These codes also facilitate future technologies. For instance, smart phone apps can be used more efficiently when users can input short numeric codes rather than long route names.

Colours on maps make linear routes easy to understand, providing clear separation and geographic reference points.

Progressively disclose information

Messages that are clear and simple are more easily understood and memorable. However, often there are multiple messages that customers must receive and understand along their journeys. These messages may range from general information down

to specific detail. Releasing information sequentially in small amounts at predictable intervals prevents customers from being overwhelmed with too much information all at once.

This section provides guidelines on what information should be placed on signage at specific points within subway stations. Messages are designed to address two specific types of journeys; ingress and egress. Though signs will be positioned throughout the station, they may be grouped corresponding to station areas.

Keep destination names simple and consistent
 Naming principles apply equally to all modes and facility types; stations, routes and stops. There are three core principles to all naming for wayfinding information. Names should be simple, logical and permanent.

Simple names are more memorable and easier to use in the course of everyday conversation when giving directions. Anticipating how the public may simplify a place name, can lead to better adoption. For instance, naming a station Royal Ontario Museum though more descriptive, is not as expedient as simply calling it Museum. Short names are also easier to commit to memory.

An example of simplification of a station name is Vaughan Metropolitan Centre. Wayfinding signage refers to the terminus as 'Vaughan'. The full station name appears on maps, trip planning and web applications. 'Vaughan' is used on directional signage, 'You are Here' maps and other signage referring to the terminus.

Logical names assist customers in planning their journeys. Names should be connected in some manner to their geographic location. Names should also provide customers with proximity. Presently, within the system stops, routes and stations are named after; a nearby street, a large civic centre, a neighbourhood, or a historic landmark.

Names should stand the test of time. Care should be taken not to adopt a name that could easily change in the future.

Consistency in naming is important. Generally, words like 'Avenue' and 'Road' should be spelled out in full. Abbreviations are discouraged and should only be used when absolutely necessary,

for instance, when space is limited.

When referring to street names such as Bloor Street West and King Street West, remove the direction from the street name. When there are multiple exits to the same street, these cardinal directions may be used to orient customers.

Example: St Andrew Station

Northeast corner

King Street, East side
 University Avenue, North side

Southeast corner

King Street, East side
 University Avenue, South side

Northwest corner

King Street, West side
 University Avenue, North side

Southwest corner

King Street, West side
 University Avenue, South side

Present messages on signs as lists (not sentences)

Removing extraneous words such as 'and' and 'to' make messages simpler and faster to read.

Destination messages on signs should be presented as lists rather than strung together as sentences. Place destinations on different text lines or use a comma. Ampersands are not used on signage. When referencing two terminus together on the same line a '/' is used between the two terminus.

Example: Kennedy / Kipling.

2.0 Planning principles

Incorporate accessibility planning

The International Symbol of Access (ISA) is used to identify accessible pathways and services within the TTC system.

Barrier-free path of travel (accessible pathway)

A barrier-free path of travel provides an unobstructed path of travel within the transit facility for persons with physical or sensory disabilities and others with mobility issues. This pathway may include ramps, passenger elevators or other platform equipped passenger elevating devices.

Accessible transit services plan

The TTC is committed to making its services accessible in order to better meet the needs of seniors and people with disabilities in the City of Toronto, and has a systematic program in place to ensure that this is accomplished in a cost-effective and timely manner.

The Commission also subscribes to the *City of Toronto Accessibility Design Guidelines*.

Identification of barrier-free entrances and exits
All transit facility entrances that are barrier-free are to be signed with the International Symbol of Access (ISA). In the event that only one entrance to the facility is accessible, an accessible pathway using the ISA symbol should be signed to the closest accessible entrance.

Identification of barrier-free path of travel

When the barrier-free path of travel deviates from the normal path of travel, the International Symbol of Access (ISA) is used to identify the accessible pathway.

Identification of barrier-free devices

When the barrier-free path of travel includes the use of an accessible device (e.g. ramp or elevator), the device is identified along the barrier-free path of travel at the immediate location of the accessible device. This is to done specifically to inform users of a change in the barrier-free path of travel prior to their arrival at the device.

Identify where elevators lead to

In many TTC stations several elevators provide passage between street level and subway platforms. Customers may need to use one elevator to reach a concourse level and then choose between one of two elevators that lead down to different platforms and levels. Therefore, it is crucial that signage identifying elevators includes destination information so that customers can identify the correct elevator.

Non-accessible entrances

At accessible stations, non accessible entrances require redirect signage to the nearest accessible entrance. This is an AODA requirement.

Example:

Accessible entrance on other side of St Clair Avenue
Accessible entrance at north side of station

Second exits

All entrances to the station show the modalities available at the station. For second exits, additional signage is required on the pathway to let customers know they need to use the platform to transfer to other modalities.

Streetcar / bus platforms

Station identification is not required on platforms. The focus should be placed on wayfinding to other modalities at the station.

Stair and escalator directional

When a platform has a stair / escalator combination, the sign pointing into the path only shows an escalator.

A diagonal arrow is only used for a wall mounted sign beside a staircase or escalator.

Suspended sign

Content on any suspended sign with forward or down arrow is centered and nudges customers to the appropriate side of the pathway.

Design signs to last

Signs within the transit system are designed for long service life in all aspects. Typically, the minimum life expectancy should be ten years. Though there are many examples throughout the system of signage that is as old as the system and still provide vital wayfinding information to our customers.

Signs that are within reach of customers (any sign within 2400 mm above finished floor) are exposed to possible damage from tampering and vandalism. The materials and fabrication methods chosen should take into account the likelihood that signs may receive hammer blows, felt markers, scratching, burning, spray paint, etc.

Signs should be corrosion resistant. Where there is potential for electrochemical corrosion between metals, protective coating films, sealants or insulating membranes shall be applied. Examples include;

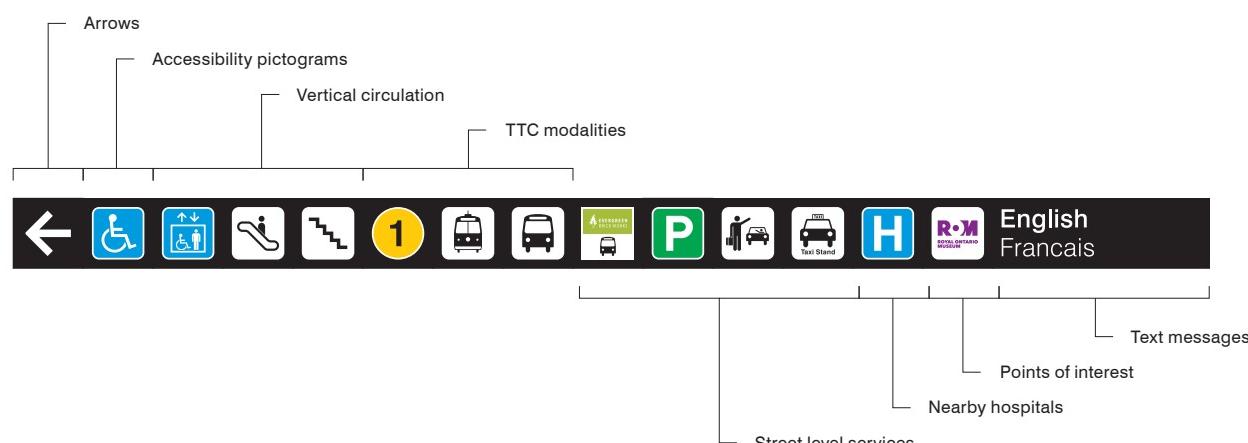

- Aluminum to stainless steel, brass, bronze, copper, zinc;
- Stainless steel to brass, bronze, copper, zinc;
- and metals to concrete or masonry.

Additionally, signs should be resistant to environmental factors that may dislodge them. For instance, vibrations, wind pressure, severe temperature change and the rigours of regular cleaning. Refer to Design Manual 0301-02 environmental loads for more information.

This manual details standard materials use for each sign type in section 4.0 Sign typology.

Sequence of information presentation

Consistent sequencing contributes to simplicity and readability. For example, pictograms are always positioned in a hierarchical sequence. The diagram below illustrates the proper sequence of graphic elements on typical TTC signs.

3.0 Graphic elements

Table of contents

3.1	Graphic elements	3.2
3.2	TTC logo	3.3
3.3	Typography	3.4
3.4	Colour	3.6
3.5	Arrows	3.10
3.6	Line numbering	3.12
3.7	Route numbering	3.14
3.8	Logos	3.22
3.9	Pictograms	3.31
3.10	Text modules	3.67

3.1 Graphic elements

TTC signs are created by combining a number of components, such as: standardized layout grids, corporate fonts, logos, symbols and frames. We refer to these components as 'Graphic elements'.

This section of the Standards seeks to explain what these elements are, how they are designed and how they are used to create signs. Generally, these elements should be considered 'standard' meaning that they have been approved for use within the TTC's sign system and therefore should not be altered or replaced unless approved.

3.2 TTC logo

3.2.1 The TTC Logo

Consistent application of the TTC logo is vital to maintaining consistent corporate identity for the TTC. TTC logos are included on signage at points of entry into the system; that is, at points when customers access the system, station entrances, bus and streetcar stops, and vehicles.

3.2.2 Backgrounds

The TTC Logo appears against white and black backgrounds on TTC signage. Note that when positioned against a background other than white, a white outline appears around the logo. This outline is included within the official logo files.

3.3 Typography

3.3.1 – Swiss 721 BT

The primary typeface for TTC signage is Swiss 721 BT. It is a highly readable sans serif font. The design of individual letters complies with proportional requirements for the Access for Ontarians with Disabilities Act (AODA). Swiss 721 BT is used in six weights; Light, Regular, Medium and Bold. Swiss 721 is a Bitstream (BT) font available at www.myfont.com.

The integrity of the font should be maintained at all times. No vertical or horizontal scaling, no added stroke, etc. To ensure consistency, always use Swiss 721 and not Arial or a substitute font.

Due to licensing restrictions, TTC is unable to provide copies of this typeface.

Swiss 721 BT Light

ABCDEFGHIJKLMNOPQRSTUVWXYZ
abcdefghijklmnopqrstuvwxyz
abcdefghijklmn
opqrstuvwxyz
1234567890.,,:&

3.3.2 – Bloor-Yonge

Swiss 721 is used for most wayfinding signage. However, exceptions occur on several sign types that refer to station and streetcar stops. In these instances the Bloor-Yonge font is used. Bloor-Yonge is available for free download from TTC Design and Wayfinding (wayfinding@ttc.ca). The Bloor-Yonge font consists of upper case letters, numerals and several punctuation symbols.

Swiss 721 BT Regular

3.4 Colour

Primary colour palette

Primary colours are used to identify major elements within the system such as subway lines, exits and accessible features. Each has been named after the element that it is most closely associated with.

Colours are specified using different colour matching systems depending on the method of fabrication. Generally, better quality and consistency is achieved when TTC designers specify exactly which colour is desired using an applicable colour matching standard rather than relying on fabricators

to interpret TTC requirements based on a 'close' match. Therefore, each colour can be identified several ways depending on the application. For example, when printing digitally, Line 1 Yellow should be identified as C0 M20 Y100 K0. When using 3M vinyl products, it should be identified as 3M 3620-25 – Sunflower.

The colour table shows all the typical colour matching systems used for TTC signage.

	Colour Name	Applications	PANTONE	CMYK	RGB	3M Translucent	3M Opaque	3M Reflective	Gerber Foil	Matthews Paint

3.5 Arrows

Arrows are used throughout the system to direct passengers. The shape and size of arrows is controlled by utilization of arrow modules that ensure consistent appearance in all applications.

Arrow placement

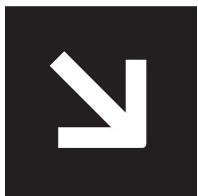

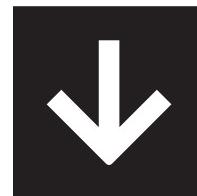

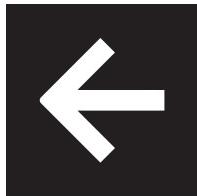

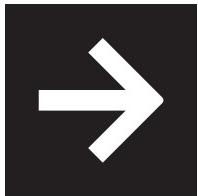

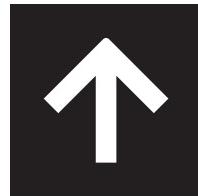

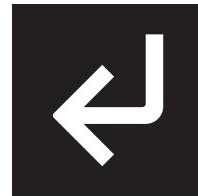

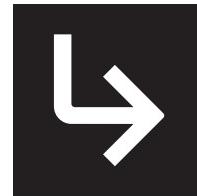

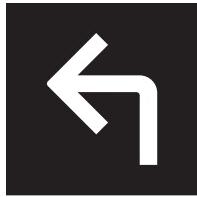

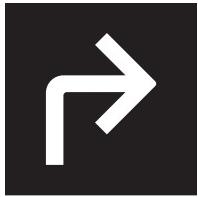

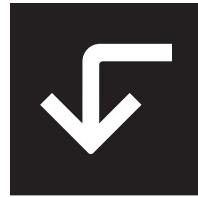

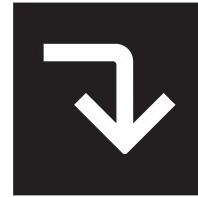

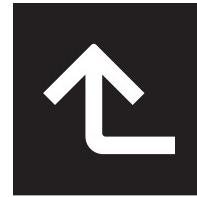

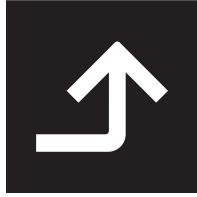

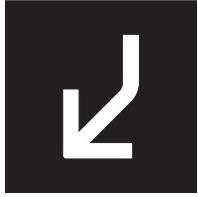

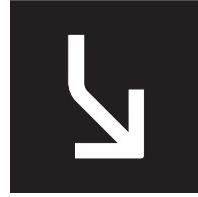

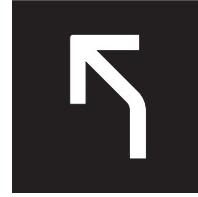

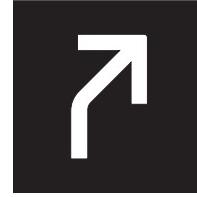

Arrows indicating direction to the left should be placed on the left.

Arrows indicating direction to the right should be placed at the right.

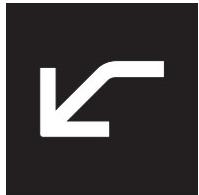

Left arrow usage

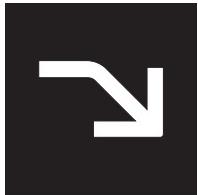

Right arrow usage

3.6 Line numbering

The TTC uses numeric codes along with street/destination names to identify bus, streetcar and subway line/routes. Letters are appended to identify route variations.

Numeric line/route codes offer several advantages;

- More accessible to customers with language or cognitive barriers;
- Provide a mnemonic reference that is easy for customers to remember;

- More conducive for integration with mobile technologies;
- Consistent with principals of universal design.

Numbers are typically assigned to routes by TTC Service Planning based on the order that routes go into service.

Subway lines are also identified with coloured circles as a secondary distinctive element.

Text modules

Text modules have been developed in formats ideal for constructing TTC sign layouts. They encapsulate the correct weights, size and typeface set proportionally within the TTC's modular layout system. These text modules contribute to accuracy and consistency. Choice of which module is used is left to the designer based on a number of criteria:

Size of sign frame, orientation of information (flush-right or flush-left, size and amount of message content, etc). Consideration of viewing distance and information hierarchy may also influence module choice.

Non-tactile directory

Elevator – Non-tactile directory
Elevation
1:50

Design note:
Non-tactile directories should be placed next to the elevator control buttons. When glazing next to the elevator controls is not available the adjacent wall can be used.

If wall does not allow for 500 mm, center directory on the available space.

Non-tactile directory
Detail
1:10

Design note:
When destinations are accessible via another elevator, use a two line text module with "Transfer to" to indicate a transfer is required
